IMPACT UNDERWRITING: SUSTAINABLE INSURANCE AS AN OPPORTUNITY FOR SOCIETY AND BUSINESS

30 July 2020

04 'Impact underwriting' can accelerate the global economy's sustainable transformation

06 The 'double dividend': Business opportunities in impact underwriting

EXECUTIVE SUMMARY

Morkus Zimmer, Senior Expert ESG +49 89 3800 68150 markus.zimmer@allianz.com

In collaboration with:

Kevin Gismondi, Research Assistant kevin.gismondi@allianz.com

'Impact underwriting' can accelerate the global economy's sustainable transformation. Due to its role as risk manager, risk carrier and major investor, the insurance industry is in a unique position to promote economic, social and environmental sustainability. But the way forward involves looking beyond focusing on already 'sustainable' activities. Changing for the better requires the implementation of more 'impact' activities that shift non-sustainable behavior and processes in a more sustainable direction. An impact-oriented alignment of just a fraction of the insurance industry's capital flows would be a substantial catalyst for achieving the global sustainability goals.

Impact underwriting can offer a 'double dividend', generating revenues in a growing market besides realizing positive externalities for society. In this context, we identify 9 fields of sustainable action for the insurance sector:

- 1. Climate change & weather extremes: Global tropical cyclone storm intensity, for instance, is expected to increase by 5% and rain intensity by 15%. The risk associated with such disasters are increasingly covered via alternative risk transfers and impact underwriting needs to close existing insurance gaps.
- 2. **Renewable energy investments**: Global renewable energy capacities will more than triple by 2050. Accordingly, the demand for insuring renewable energy installations against physical, development or operational risks will rise. Risk consulting and risk service solutions support establishing new technologies or developing new territories and provide further opportunities for sustainable insurance solutions.
- 3. Alternative mobility: In 2024 a tipping point will be reached when battery electric vehicles (EV) become cheaper than internal combustion engines (ICE) for passenger vehicles. EVs will dominate new car sales before 2040. Impact underwriting can support this transition by offering insurance solutions to the areas of mobility sharing as well as autonomous driving, and can seize new opportunities in the sector coupling of vehicle batteries with the energy infrastructure.
- 4. **Real estate**: Non-financial barriers are a major obstacle against the demand of energy efficiency measures. Insurance can play an important role as mediator, service provider, and risk bearer and thus accelerate the implementation of efficiency gains.
- 5. Sustainable lifestyle: Improvements in the energy efficiency of appliances have come short of expectations due to rebound effects resulting from an increase in the usage of the appliances and a larger number of appliances per person. Impact insurance can counter-act this trend by offering lower premiums for eco-friendly appliances, cars and buildings. Sustainable insurance claim regulation can allow for upgrades to eco-labelled appliances and machinery and, due to a life-cycle analysis of the emissions associated to a product, appliances might rather be repaired instead of replaced.
- 6. **The future of work**: Home office usage could double in the foreseeable future and impact underwriting can support the transition towards 'new work' and the sharing economy by reducing implementation barriers resulting from risk averseness, especially coupled with the underlying digitization.
- 7. **Digitization & sector coupling**: The realization of the energy transition or the sharing economy depends on the progress in digitization. Blockchain is a central enabling technology and its market size is expected to more than double within the next five years. Sector coupling leads to networked electric car batteries functioning as energy system storage, smart appliances' energy demand being regulated according to energy supply and 'prosumers' sharing their self-generated electricity in communities. Impact underwriting can lower the associated risks and thus promote progress towards sustainability.
- 8. **Emerging customers and regions**: Half of global population is still not connected to the internet. With increasing access to mobile phones, the insurance industry will be able to provide impact insurance solutions to new population groups that are particularly challenged. For instance, in the area of agricultural insurance, insurers could provide microinsurance and further communicate weather alerts for livestock or crops, to support the decision-making of farmers.
- 9. **Ecosystem**: Intensifying rainfall and heat waves result in crop yields becoming more erratic, emphasizing the need for insurance and the role of impact underwriting.

'IMPACT UNDERWRITING' CAN ACCELERATE THE GLOBAL ECONOMY'S SUSTAINABLE TRANSFORMATION

In its role as risk manager, risk carrier 1. and investor, the global insurance industry is in a unique position to promote economic, social and environmental sustainability. The vast capital flows and long-term horizon associated with its • investment and underwriting businesses can help drive our society's transition from narrowly focusing on short-run pro- 2. fits and job prospects to building a . green, fair and inclusive economy. But the way forward involves looking beyond 'sustainable' actions and processes, which aim to preserve a preferred state, and focusing more on 'impact', namely actions and processes 3 that shift non-sustainable behavior and processes in a more sustainable direction. An impact-oriented alignment of just a fraction of the insurance industry's capital flows would be a substantial catalyst for achieving the global sustainability goals¹.

As Environmental, Social and Governance (ESG) methodologies and frameworks develop and start to be incorporated in risk evaluation, an increasing number of high exposures and extensive vulnerabilities have been identified in the insurance sector itself, which has the challenging position of being concerned with ESG from three different positions:

- ESG in own operations
- tions beyond traditional Corporate tion, structure and remuneration. Social Responsibility (CSR) ap- As seen in Figure 1, the shift from responproaches.
- tomers and regions.
- ESG in asset management
- management in-(responsible vestment).
- Engagement, active ownership, citizenship aood corporate (sustainable investment).
- ESG in insurance underwriting
- ESG factors in underwriting (responsible underwriting).
- Sustainable and inclusive insurance products (sustainable underwriting).

In asset management, 'impact' investment could be defined as achieving environmental or social benefits beyond the nexus of the investor's shareholder benefits. Similarly, 'impact underwriting' is about more than just having sustainable insurance solutions in the portfolio; rather, it is about actively shaping and contributing to society². The ESG factors to be considered by the insurer include its attitude and behavior (1) on environmental issues such as resource depletion, climate change, waste and pollution, (2) regarding social aspects, workers and local communities, including health and safety issues and (3)

referring to corporate policies and gov-Sustainable and inclusive opera- ernance, including tax strategies, corrup-

sible to sustainable underwriting is hard-Philanthropic support of environ-ly a choice: To stay competitive in the ment, low-income and high-risk cus- market, insurance companies must not only adapt to current and future regulations, but also satisfy investors' increas-ESG factors in investments and asset ing demand for sustainable products. Part of the increasing demand results from companies changing their reporting practices to better reflect their commitment to ESG factors, aiming at measuring their resilience against long-term, financially relevant risks³. These involve different product lines of insurance, including employers' liability, directors and officers, product liability and public liability. Related to these risks, the increasing demand for the mitigation of factors that can cause significant reputational harm is an undeniable and observable trend. Information travels quickly due to social media and negative publicity related to ESG, including impacts on brand recognition and reputation, pose an increasing threat to companies. The once non-financial and intangible perception of ESG is increasingly evolving into a financial and tangible factor for the decisions of customers, suppliers, employees, regulators, analysts and other stakeholders. All this presents several ESG market opportunities, which we explore in the next section⁴.

¹Sustainability goals are manifold with the Sustainable Development Goals (SDGs) and the European Green Deal being two of the most prominent ones.

² As mentioned above, the difference between sustainable and impact should be emphasized. While 'sustainable' refers to the desired state, 'impact' refers to activities that support progressing towards this state. ³ These are driven by customer demands as well as by regulatory frameworks and requirements derived from processes like the Task Force on Climate-related Financial Disclosures (TCFD) and the EU Taxonomy. ⁴ PSI and Allianz launched the first guide to managing sustainability risks in insurance underwriting (UN Environment's Principles for Sustainable Insurance Initiative, 2019). It aids the ESG due diligence process for clients and transactions, provides guidance on integrating ESG risk considerations and rises awareness of ESG opportunities.

Figure 1: Impact underwriting - the evolution from 'responsible' to 'sustainable' underwriting

Responsible underwriting (GOOD BUSINESS)

Considers environmental and social indicators that are relevant for determining the underwriting risks

- Reduce risk exposure through risk
 management
- Time horizon limited on contract duration
- Sustainability is not idealism but plain business sense

Society / consumers / regulators demand for more sustainability

> Companies are on the journey (or left behind)

Sustainable underwriting (GOOD CORPORATE CITIZEN)

Cares for societal impact and long-term impacts

- Responsibility to reduce our negative impact and contribute to positive development through our choices and behaviors
- With business as usual the world as we know it will change drastically in the long-run, businesses might not survive and we might not survive
- We all have a responsibility as citizens, consumers and professionals

THE 'DOUBLE DIVIDEND': BUSINESS OPPORTUNITIES IN IMPACT UNDERWRITING

As sustainable insurance solution markets offer particularly high growth potentials, engagement in impact underwriting offers a 'double dividend⁵', generating revenues in a growing market as well as realizing positive externalities for society. Table 1 lays out criteria and definitions for sustainability in the context of impact underwriting in insurance.

Focus on	Environmental criteria	Social criteria
reducing the risk of possible future occurrence of hazard event ⁶ (mitigation)	Support the development of a technology/market focusing on the environment and/or climate change (e.g. renewable energy, environmental goods and services, green infrastructure) and further activities in the mitigation of climate change (e.g. encouraging or rewarding environmentally responsible behavior that improves energy efficiency or avoids pollution).	Raises awareness through various activities (e.g. cause-related marketing or support schemes) to prevent and mitigate social challenges in relation to socially disadvantaged groups.
reducing the inventory of elements that may be affected by hazard event ⁷ (adaptation)	Reduce the client's exposure to financial (risk reduction) and/or regulatory risks (e.g. CO2 regulations, environmental pollution liability). Protection from environmental risks and adaptation to climate change impacts through managing clients' risks (e.g. weather risks) and/or fostering risk awareness and/or providing incentives for reducing risk exposure.	Fosters socially responsible behavior by offering specifically tailored solutions for socially disadvantaged groups (for e.g. reducing the risk of underserved groups by providing otherwise unavailable access to financial services). A discount on such policies would partly apply.
reducing the impact to exposed elements when they suffer hazard event ⁸ (resilience)	Conservation of at least one of the following: natural resources, biodiversity, environment. Activities and structural changes that reduce the impact of extreme events or accelerate the recovery from those.	Enable and/or support those that tackle social challenges and issues faced by socially disadvantaged groups ⁹ . These include products that 'help the helper' (for e.g. travel insurance for charity workers, insurance solutions tailored for social value-adding products/services that would otherwise not be insured).

Table 1: Criteria for sustainable insurance solutions

Note: This table is an extension and adaptation of the criteria in Allianz (2018) *Source: Allianz Research*

The scope of the definitions covers environmental and social criteria and spans from mitigation over adaptions to resilience. In this paper, the criteria for sustainable insurance products are applied to the three ESG risk components of:

- physical risk: e.g. tangible losses from natural catastrophes, disruption of supply chains or rising morbidity and mortality
- transition risk: e.g. disruptions of business models by changing demand preferences, technologies or regulation
- liability risk: e.g. claims of third parties who have suffered loss and damage from an ESG hazard.

Based on this, we identify the business opportunities ahead in nine fields of sustainable action:

⁸ In Cardona et al. (2012) this would refer to vulnerability and is closely related to the concept of resilience (though resilience is often alternatively interpreted as the combination of mitigation and adaptation): "Vulnerability refers to the propensity of exposed elements such as human beings, their livelihoods, and assets to suffer adverse effects when impacted by hazard events. Vulnerability is related to predisposition, susceptibilities, fragilities, weaknesses, deficiencies, or lack of capacities that favor adverse effects on the exposed elements."

⁹ Socially disadvantaged groups are defined as populations that are excluded in their local society for reasons that may be tied to age, sex, disability, race, ethnicity, origin, religion or economic or other status.

⁵ A term originally relating to the work of Tullock (1967) who extended the idea of taxing externalities according to Pigou (1920).

⁶ In Cardona et al. (2012) this would refer to hazards and is closely related to the concept of mitigation: "Hazard refers to the possible, future occurrence of natural or human-induced physical events that may have adverse effects on vulnerable and exposed elements. Although, at times, hazard has been ascribed the same meaning as risk, currently it is widely accepted that it is a component of risk and not risk itself." ⁷ In Cardona et al. (2012) this would refer to exposure and is closely related to the concept of adaptation: "Exposure refers to the inventory of elements in an area in which hazard events may occur. Hence, if population and economic resources were not located in (exposed to) potentially dangerous settings, no problem of disaster risk would exist. While the literature and common usage often mistakenly conflate exposure and vulnerability, they are distinct. Exposure is a necessary, but not sufficient, determinant of risk. It is possible to be exposed but not vulnerable. However, to be vulnerable to an extreme event, it is necessary to also be exposed."

Climate change and weather extremes

As environmental indicators measuring anthropogenic impact continue their long-term post-industrial rise, physical risks such as the tangible disaster losses from natural catastrophes are mounting. Figure 2 shows that the frequency of natural disasters has been increasing in recent years, and researchers predict more severe meteorological and hydrological events to come (Knutson et al. 2010). Recent evidence from a metastudy by Knutson et al. (2020), shows that global tropical cyclone storm intensity, for instance, is expected to increase by 5% and rain intensity by 15%.

The physical impact of these natural disasters on value chains and trade rela insurance to generate positive impacts: ready started seizing opportunities to Both economic and insured losses resul ting from weather-related catastrophes risk transfers. Figure 3 shows the increashow an upward trend. Moreover, areas sed participation in the insurance-linked with high industrial activity are often securities market, especially for catasconcentrated in coastal areas, and trophe bonds¹¹, designed to hedge along rivers and river deltas, putting sponsors against losses caused by natuthem particularly at risk of extreme wea- ral disasters. The role of the financial sector, especially provision of effective insurance is also a runs, given a 2.5°C increase in global the insurance industry, in protecting and way to facilitate a more productive agri- mean temperature. While the losses in restoring natural landscapes could becultural sector. Intensifying rainfall and average yields are particularly affecting come crucial in the future. The conservaheatwaves are making crop yields more developing and emerging countries, in- tion of a valuable natural asset is createrratic, emphasizing the need for insur- creases in yield variability are expected ing a scalable new market for the insurance and the role of impact underwrit- in much of the Northern Hemisphere, ance industry and could be applied to particularly in North America, Central other regions and ecosystems. Investing

ent underlying climate change scenarios natural landscapes can also be subject warming. The double dividend claim (analyzing various scenarios in various to sustainable insurance solutions. Some remains plausible: Public-private collabdifferent models). The red areas indicate natural assets, such as coral reefs, can be orations between the insurance industry a significant (more than 5%) decrease much more effective in carbon capture and local governments allow to measure and the blue areas a significant increase than man-made solutions. The world's how much risk, for instance a reef, can in the respective crop yield, for the indi-first insurance policy on a coral reef is reduce. Insuring nature equals ensuring cated share (>50% or >75%) of the un- now in place in Mexico²¹. By protecting a resilient future as long-term consederlying model runs, given a 2.5°C in- the Mesoamerican coral reef off the quences from exploiting the nature are crease in global mean temperature. Still, coast of Mexico's Yucatan Peninsula, the expected be much more costly. At the with rising average temperature it is pre- region's ability to sustain itself economi- same time, local economies benefit ecodicted that also the variance of tempera- cally is being ensured. More specifically, nomically as tourism will be based on a ture and precipitation will be impacted, if the reef would die, it would no longer more sustainable foundation. Investing including an increase in the frequency be able to prevent beach erosion, which, in nature will not cause economic damand duration of extreme events. When in turn, would threaten the region's key age. On the contrary, perhaps, it will be a evaluating the effect of climate change source of income, tourism. Nature-based key driver for many economies to survive on crop yields it is crucial to account not insurance solutions can help to speed up and flourish in the future.

in nature is gaining importance in multi-model simulation study for differ- Besides agricultural and crop insurance, fighting the consequences of global

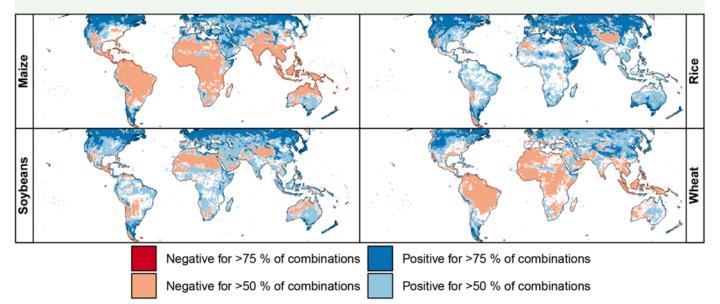

Figure 12: Changes in crop yields at different levels of global warming

Note: Percentage of crop model simulations indicating an increase (blue) or decrease (red) in yield of greater than 5% at each grid point at 2.5°C increase in GMT²⁰ as compared to the historical period for maize, rice, soybeans and wheat under rain-fed conditions. White indicates either a change of less than 5% or disagreement among the models in the direction of yield change. *Source: Ostberg et al. (2018)*

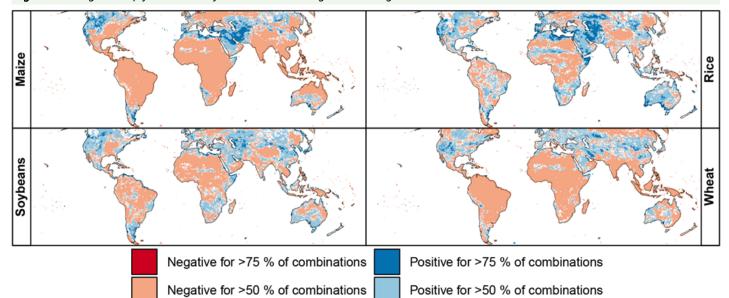

Figure 13: Changes in crop yields variability at different levels of global warming

Note: Percentage of crop model simulations in the 2.5°C warming bin indicating an increase (blue) or decrease (red) in yield variance of greater than 5% compared to the historical period (1980–2010), for maize, rice, soy, and wheat under rain-fed conditions. White indicates either a change of less than 5% or disagreement among the models in the direction of change. *Source: Ostberg et al. (2018)*

FORWARD-LOOKING STATEMENTS

The statements contained herein may include prospects, statements of future expectations and other forward-looking statements that are based on management's current views and assumptions and involve known and unknown risks and uncertainties. Actual results, performance or events may differ materially from those expressed or implied in such forward-looking statements.

Such deviations may arise due to, without limitation, (i) changes of the general economic conditions and competitive situation, particularly in the Allianz Group's core business and core markets, (ii) performance of financial markets (particularly market volatility, liquidity and credit events), (iii) frequency and severity of insured loss events, including from natural catastrophes, and the development of loss expenses, (iv) mortality and morbidity levels and trends, (v) persistency levels, (vi) particularly in the banking business, the extent of credit defaults, (vii) interest rate levels, (viii) currency exchange rates including the EUR/USD exchange rate, (ix) changes in laws and regulations, including tax regulations, (x) the impact of acquisitions, including related integration issues, and reorganization measures, and (xi) general competitive factors, in each case on a local, regional, national and/or global basis. Many of these factors may be more likely to occur, or more pronounced, as a result of terrorist activities and their consequences.

NO DUTY TO UPDATE

The company assumes no obligation to update any information or forward-looking statement contained herein, save for any information required to be disclosed by law.
